Q&A

VERIFICATION OF QUANTUM COMPUTING AND THE BLOCH SPHERE REPRESENTATION

Chris Henson

Drexel University

CURRENT RESEARCH/MOTIVATION

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
Coq

Q&A

- proof assistants are programming languages that allow formal proofs of mathematical theorems
- quantum computing is a great candidate for formal verification: it is both conceptually unintuitive and practically expensive
- algorithms such as Grover, Shor, etc. have been formally verified in languages such as Coq, Isabelle/HOL, etc.
- methods for optimizing general quantum circuits can also be verified
- some formalization frameworks provide the ability to export to formats such as OpenQASM and provide bindings in more accessible languages like Python

THE BLOCH SPHERE

CURRENT
RESEARCH/
MOTIVATION

$SU(2) \rightarrow$
 $SO(3)$

PROOF IN
CoQ

Q&A

- Why do we expect any connection between qubits and a sphere?
- In a sense the relationship between a qubit and a complex number is the same as complex and real numbers

FIGURE: Bloch sphere representation of a Qubit

GROUPS

CURRENT
RESEARCH/
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
COQ

Q&A

DEFINITION (GROUPS)

A group is a set G with operation \cdot , such that:

- $\forall a, b \in G : a \cdot b \in G$
- $\forall a, b, c \in G : (a \cdot b) \cdot c = a \cdot (b \cdot c)$
- $\forall a \in G, \exists \mathbb{1} \in G : a \cdot \mathbb{1} = a = \mathbb{1} \cdot a$
- $\forall a \in G, \exists a^{-1} \in G : a \cdot a^{-1} = \mathbb{1}$

DEFINITION (GROUP HOMOMORPHISM)

Given two groups (G, \cdot) and (H, \times) , a function $f : G \rightarrow H$ is a homomorphism if $\forall g_1, g_2 \in G : f(g_1 \cdot g_2) = f(g_1) \times f(g_2)$

DEFINITION (GROUP ISOMORPHISM)

A homomorphism $f : G \rightarrow H$ that is bijective (one-to-one and onto) is called an isomorphism

GROUPS

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
COQ

Q&A

DEFINITION (SPECIAL UNITARY GROUP)

SU(2) is the group of all 2×2 complex matrices that are unitary ($A^\dagger A = I_2$) and have determinant 1. It can be parameterized by

$$A = \begin{pmatrix} \alpha & \beta \\ -\bar{\beta} & \bar{\alpha} \end{pmatrix}, \quad |\alpha|^2 + |\beta|^2 = 1$$

DEFINITION (SPECIAL ORTHOGONAL GROUP)

SO(3) is the group of all 3×3 real matrices that are orthogonal ($A^\top A = I_3$) and have determinant 1.

QUATERNIONS

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
COQ

Q&A

DEFINITION (QUATERNIONS)

A quaternion may be described by the expression

$$a + b\mathbf{i} + c\mathbf{j} + d\mathbf{k} \quad a, b, c, d \in \mathbb{R}$$

where the basis quaternions $1, \mathbf{i}, \mathbf{j}, \mathbf{k}$ additionally satisfy

$$\mathbf{i}^2 = \mathbf{j}^2 = \mathbf{k}^2 = -1,$$

$$\mathbf{i}\mathbf{j} = -\mathbf{j}\mathbf{i} = \mathbf{k}, \quad \mathbf{j}\mathbf{k} = -\mathbf{k}\mathbf{j} = \mathbf{i}, \quad \mathbf{k}\mathbf{i} = -\mathbf{i}\mathbf{k} = \mathbf{j}.$$

and have 1 as a left and right identity.

QUATERNIONS

CURRENT
RESEARCH/
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
COQ

Q&A

- We can also view quaternions as pairs of complex numbers $(a + bi, c + di) \equiv a + b\mathbf{i} + c\mathbf{j} + d\mathbf{k}$
- This idea of repeatedly taking a product of an algebra with itself is referred to as the *Cayley–Dickson construction*, where at each step we lose some property of the algebra
- Another way of viewing the quaternions that connects with quantum computing is through an isomorphism to the Pauli matrices. One such isomorphism is given by:

$$\mathbf{1} \mapsto I_2, \quad \mathbf{i} \mapsto iZ, \quad \mathbf{j} \mapsto iY, \quad \mathbf{k} \mapsto iX$$

- By identifying the *pure imaginary* quaternions ($a = 0$) with \mathbb{R}^3 , we can model rotations in a numerically stable way
- This is the intuition behind the Bloch sphere, that both qubits and quaternions can be represented by pairs of complex numbers

$$\mathrm{SU}(2) \cong \mathbb{S}^3$$

CURRENT
RESEARCH/-
MOTIVATION

$\mathrm{SU}(2) \rightarrow$
 $\mathrm{SO}(3)$

PROOF IN
COQ

Q&A

More formally, we have that the groups $\mathrm{SU}(2)$ and \mathbb{S}^3 of unit quaternions are isomorphic. The isomorphism can be written quite neatly:

$$a + b\mathbf{i} + c\mathbf{j} + d\mathbf{k} \rightarrow \begin{pmatrix} a + bi & c + di \\ -c + di & a - bi \end{pmatrix}$$

$$\mathbb{S}^3 \rightarrow \mathrm{SO}(3)$$

CURRENT
RESEARCH/
MOTIVATION

$\mathrm{SU}(2) \rightarrow$
 $\mathrm{SO}(3)$

PROOF IN
COQ

Q&A

DEFINITION (CONJUGATION MAP)

Consider a three dimensional vector represented as a pure imaginary quaternion $r \in \mathbb{R}^3 \cong \mathbb{R}\mathbf{i} + \mathbb{R}\mathbf{j} + \mathbb{R}\mathbf{k}$ and a unit quaternion $q \in \mathbb{S}^3$.

The conjugation of r is given by the map $\mathbb{R}^3 \rightarrow \mathbb{R}^3$ given by

$$r \rightarrow qrq^{-1}$$

and can be shown to be a rotation. Additionally we have that $qrq^{-1} = (-q)r(-q)^{-1}$

$$\mathbb{S}^3 \rightarrow SO(3)$$

CURRENT
RESEARCH/-
MOTIVATION

SU(2) →
SO(3)

PROOF IN
Coq

Q&A

For a unit quaternion $a + b\mathbf{i} + c\mathbf{j} + d\mathbf{k}$, the homomorphism can also be expressed directly as:

$$\begin{pmatrix} 1 - 2c^2 - 2d^2 & 2bc - 2da & 2bd + 2ca \\ 2bc + 2da & 1 - 2b^2 - 2d^2 & 2cd - 2ba \\ 2bd - 2ca & 2cd + 2ba & 1 - 2b^2 - 2c^2 \end{pmatrix}$$

This was known as early as Euler:

PROBLEMATIS INITIO PROPOSITI SOLUTIO GENERALIS
IN NUMERIS RATIONALIBUS

33. Coronicis loco solutionem problematis nostri e methodo DIOPHANTEA
petitam subiungam, quae sequenti modo satis concinne exhiberi potest.

Sumantur pro lubitu quatuor numeri p, q, r, s ac posita quadratorum
eorum summa

$$pp + qq + rr + ss = u$$

novem numeri quaesiti ita determinati reperiuntur¹⁾

$$A = \frac{pp + qq - rr - ss}{u}, \quad B = \frac{2qr + 2ps}{u}, \quad C = \frac{2qs - 2pr}{u},$$

$$D = \frac{2qr - 2ps}{u}, \quad E = \frac{pp - qq + rr - ss}{u}, \quad F = \frac{2pq + 2rs}{u},$$

$$G = \frac{2qs + 2pr}{u}, \quad H = \frac{2rs - 2pq}{u}, \quad I = \frac{pp - qq - rr + ss}{u}.$$

REPRESENTING MATRICES, COMPLEX NUMBERS, AND QUATERNIONS

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
Coq

Q&A

- we can represent groups abstractly, but it is somewhat interesting to directly work with the underlying types
- complex numbers and quaternions are represented as pairs of real numbers
- a matrix is represented as a function that takes two natural numbers and returns a complex number

Definition $C := (R * R)\%type$

Definition $Quaternion := (R * R * R * R)\%type.$

Definition $Matrix\ (m\ n : nat) := nat \rightarrow nat \rightarrow C.$

REPRESENTING GROUPS

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
Coq

Q&A

- groups are represented as a *typeclass*
- essentially a typeclass is a dependently-typed record, with some extra type inference capabilities
- a subtle point is that this allows *different equivalence relations*

```
Class Group (G: Type) (op: G  $\rightarrow$  G  $\rightarrow$  G) (rel: relation G) := {  
  id : G  
  ; inverse: G  $\rightarrow$  G  
  ; rel_equiv: equiv G rel  
  ; id_left {x}: rel (op id x) x  
  ; id_right {x}: rel (op x id) x  
  ; assoc {x y z}: rel (op (op x y) z) (op x (op y z))  
  ; right_inv {x}: rel (op x (inverse x)) id  
}.
```

REPRESENTING MORPHISMS

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
Coq

Q&A

Likewise, homomorphism and isomorphism can be represented with typeclasses

```
Class GroupHomomorphism G H
  (Gop: G  $\rightarrow$  G  $\rightarrow$  G)
  (Hop: H  $\rightarrow$  H  $\rightarrow$  H)
  (Grel: relation G)
  (Hrel: relation H)
  (hom_f: G  $\rightarrow$  H)
: Type
:= {
  hom_left_group: Group G Gop Grel
; hom_right_group: Group H Hop Hrel
; hom_mul {a1 a2}: Hrel
      (hom_f (Gop a1 a2))
      (Hop (hom_f a1) (hom_f a2))
}.
```

REPRESENTING MORPHISMS

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
Coq

Q&A

Another subtle point about having multiple equivalence relations is that we must prove they are “compatible”

```
Section hom_trans.
Variables A B C : Type.

Variable Arel: relation A.
Variable Brel: relation B.
Variable Crel: relation C.

Variable A_Eq: Equivalence Arel.
Variable B_Eq: Equivalence Brel.
Variable C_Eq: Equivalence Crel.

Variable AtoB: A  $\rightarrow$  B.
Variable BtoC: B  $\rightarrow$  C.

Variables Aop: A  $\rightarrow$  A  $\rightarrow$  A.
Variables Bop: B  $\rightarrow$  B  $\rightarrow$  B.
Variables Cop: C  $\rightarrow$  C  $\rightarrow$  C.

Variable BtoC_rw : Proper (Brel ==> Crel) BtoC.

Lemma GroupHomomorphism_trans:
  GroupHomomorphism A B Aop Bop Arel Brel AtoB  $\rightarrow$ 
  GroupHomomorphism B C Bop Cop Brel Crel BtoC  $\rightarrow$ 
  GroupHomomorphism A C Aop Cop Arel Crel (fun a  $\Rightarrow$  BtoC (AtoB a)).
Proof.
...
```

SUBSET TYPES

CURRENT
RESEARCH/-
MOTIVATION

SU(2) \rightarrow
SO(3)

PROOF IN
Coq

Q&A

- *Subset types* carry both a value and a proof that the values satisfies some predicate
- any function involving these types also carries a proof of closure

Definition Versor := { q | Qnorm q = 1 }.

Definition SU2 := {
 U: Matrix 2 2
 | WF_Matrix U \wedge
 (U 0 0 = Cconj (U 1 1) \wedge U 0 1 = - Cconj (U 1 0)) \wedge
 d2_det U = C1 }.

Definition S03 := {
 U: Matrix 3 3
 | WF_Matrix U \wedge Real_matrix U \wedge
 U \times (U)^T \equiv I 3 \wedge (U)^T \times U \equiv I 3 \wedge
 d3_det U = C1 }.
